

INSPECTION SERVICES

NON-DESTRUCTIVE TESTING (NDT)

Inspections are critical points in the lifecycle of an asset and are needed to ensure they remain safe and do not become the cause of an avoidable expense. A scheduled shutdown period to perform intrusive inspections can cause a major disruption to operations. Well planned and executed NDT delivers valuable data about the condition of the asset and avoids unnecessary stoppages, without compromising safety.

We ensure our inspectors are trained and qualified to the highest local or international standards. NDT inspection can be performed offshore, in subsea, difficult to access or "at height" locations. Whatever the location the inspector will be using the most practical and appropriate inspection techniques, to an inspection scheme tailored to the specific area and equipment. New techniques are continuously being evaluated to establish their value and usefulness to our clients.
